H2O Canadian 16-6 General Specifications Length: 16' 6" Beam: 35" Rocker: 2" Weight: 44lbs

H2O Composites Canadian 16-6 Canoe is a close replica of an "early settler canoe" discovered in South Western Ontario in decades past. H2o's design embodies the finest characteristics from this exceptional craft, then added their own modern technological refinements... the resulting combination may just be the ultimate "Canadian" canoe.

The essence and versatility of traditional canoes is captured with a symmetrical style hull and recurved ends, made famous by First Nations Peoples. To reduce wind resistance and maximize efficiency a slightly longer length and narrower beam are carefully combined with sharp entry & exit lines and a lower sheer. The Canadian's shallow arch hull design and shoe keel provide a rare blend of performance and stability sought by many canoe builders - but seldom achieved. An exceptional shoe keel design aids tracking, protects against grounding, while sacrificing little in the way of maneuverability.
